Kidney failure is known as end-stage renal disease (ESRD) because it's the last stage of chronic kidney disease. This means that one or both of your kidneys no longer function on their own. ESRD can be very scary for patients and their families. Fortunately, today's advances in medicine are delivering better treatments and outcomes for individuals with ESRD.

Abstract Depression or the  
presence of significant depressive  
symptoms remains common in  
patients with end-stage renal  
disease (ESRD). It is thought that  
20-30% of ESRD patients have  
significant depressive symptoms,  
although there are issues  
surrounding the assessment of  
depression among patients with  
physical illness.

The End Stage Renal Disease Workgroup on End-of-Life Care recommends that dialysis units facilitate advance care planning, yet this is not occurring. 4 5

Patients often do not know that they have the option to withdraw from dialysis, 6 - 8 and relatively few choose a do not resuscitate order,9 despite the extremely poor chance of survival in these patients after cardiopulmonary resuscitation.10 Patients undergoing dialysis typically do not view themselves as terminally ill and falsely ...
