The Physical Origins of Partial Differential Equations. The initial condition is  $u(x,0) = 0$  and the boundary condition is  $u(0,t) = n_0$ . To solve the equation go to characteristic coordinates  $\xi = x - ct$  and  $\eta = t$ . Then the PDE for  $N = N(\xi, \eta)$  is  $N_\xi = \eta N_\eta$ . Separate variables and integrate to get  $2 \ln N = \eta^2 + f(\xi)$ .

Thus the solution of the partial  
differential equation is  $u(x,y)=f(y+\cos x)$ . To verify the solution, we use  
the chain rule and get  $u_x = -\sin x f'(y+\cos x)$  and  $u_y = f'(y+\cos x)$ . Thus  $u_x + \sin x u_y = 0$ , as desired.

## Applied Partial Differential Equations with Fourier Series ...

In mathematics, an ordinary differential equation (ODE) is a differential equation containing one or more functions of one independent variable and the derivatives of those functions. The term ordinary is used in contrast with the term partial differential equation which may be with respect to more than one independent variable.
