Most studies, however, do not allow a comparison between different dimensions of such uncertainty because they focus on specific indicators, particular regions or different periods. In order to gain comparable results, this paper tests the most prominent uncertainty measures in investment regressions using the same specifications while holding constant the country sample as well as the time period. We find a number of indicators that are significant and robust to changes in specification. The paper concludes with a comparative evaluation of the quantitative effects of the significant uncertainty indicators on aggregate rates of investment.
