• Once patients are enrolled and their outcomes known, information accumulates that reduces uncertainty regarding optimal treatment approaches • Adaptive clinical trials are designed to take advantage of this accumulating information, by allowing modification to key trial parameters in response to accumulating information and according to predefined rules

Bayesian statistical methods facilitate adaptive dose-finding and randomization, and have a long history of success in early phase clinical trial settings where patients and other resources are scarce and/or where reliable external information is available.

MUCE is a Bayesian solution for cohort expansion trials where multiple dose(s) and multiple indication(s) are tested in parallel. Such methods are particularly important for areas like oncology where several doses and several indications must be tested for successful completion of early phase trials, and optimal choice of dose and population to move on from early phase to a reasonable dosage ...

Adaptive or 'flexible' designs have emerged, mostly within frequentist frameworks, as an effective way to speed up the therapeutic evaluation process. Because of their flexibility, Bayesian methods have also been proposed for Phase I through Phase III adaptive trials; however, it has been reported that they are poorly used in practice.

Bayesian Adaptive Designs. In clinical research, Bayesian statistical methods provide a framework in which information beyond that collected in a particular clinical trial can be used to make statistical inferences about the treatment outcomes. Prior information (from previous trials, scientific research or "expert opinion") can be combined with information as it is accrued during a trial, as well as with the usual data available on completion of the trial, to make efficient and timely ...

Abstract. We develop a novel two-stage Bayesian adaptive trial design for pediatric settings which borrows information from previously completed trials in adults to support establishing substantial evidence of efficacy for the pediatric population in situations where information extrapolation from adults is justifiable. At the time of the stage I analysis, the extent of information borrowing from adult data is determined by assessing compatibility of the observed pediatric data with its ...

A balanced treatment of the theories, methodologies, and design issues involved in clinical trials using statistical methods There has been enormous interest and development in Bayesian adaptive designs, especially for early phases of clinical trials. However, for phase III trials, frequentist methods still play a dominant role through controlling type I and type II errors in the hypothesis testing framework.

Overall, the final version of the FDA industry guidance "Adaptive Designs for Clinical Trials of Drugs and Biologics" is very similar to the draft version. Only few sections underwent a major rewrite, and section B "Bayesian Adaptive Designs" was one of them. It now includes a new paragraph that reads as follows:

An adaptive design is a design that allows modifications of some aspects of the trial after its initiation without undermining the validity and integrity of the trial. It provides a mechanism for incorporating biomarker information during clinical trials. Adaptive methods for clinical trials have been studied extensively by many authors [12-16]. For example, in a response adaptive clinical trial, patient outcomes can be used as they become available to adjust the allocation ratio between ...
