Here you'll find some notes that I wrote up as I worked through this excellent book. I've worked hard to make these notes as good as I can, but I have no illusions that they are perfect.

If use (a) will win with probability p . If use strategy (b) then $P\{\text{win}\} = P\{\text{win} \cap \text{both correct}\} p^2 + P\{\text{win} \cap \text{exactly 1 correct}\} 2p(1 - p) + P\{\text{win} \cap \text{neither correct}\} (1 - p)^2 = p + p(1 - p) + 0 = p^2$

Thus, both strategies give the same probability of winning. 65.

Let I be the event the twins are identical.

From the argument above we have a recursive structure give by $p(N, 1) = \frac{1}{N} + \sum_{k=2}^{N-1} \frac{1}{N} p(N-k, 1)$ where the first term is where the first passenger picks the first seat (where the N will sit correctly with probability one), the second term is when the first passenger sits in the N-th seat (where the N will sit

Hence, the desired probability is
($n + 1/2$). 23. The answer is $5/12$,
which can be seen as follows: $1 =$
 $P \{ \text{first higher} \} + P \{ \text{second}$
 $\text{higher} \} + p \{ \text{same} \} = 2P$
 $\{ \text{second higher} \} + p \{ \text{same} \} =$
 $2P \{ \text{second ...}$

The Ross-Littlewood paradox
(also known as the balls and vase
problem or the ping pong ball
problem) is a hypothetical
problem in abstract mathematics
and logic designed to illustrate
the seemingly paradoxical, or at
least non-intuitive, nature of
infinity. More specifically, like the
Thomson's lamp paradox, the
Ross-Littlewood paradox tries to
illustrate the conceptual

This is the best Solution manual available today on sheldon ross book: "A first course in probability", I believe that learning probabilities is done by practicing lots of exercises, A first course in probability book has a lot of exercises at the end of each chapter unfortunately sheldon ross is giving only solutions to selected problems without any details, only the result is given which is not helpful when we don't know how to solve a problem.
