This cell line is adherent in cell culture and, therefore, a selected number of large-scale culture systems are available for culturing these cells. Such systems include fixed bed reactor, fluidised bed reactor and microcarrier culture. . Microcarrier culture is a popular option because of the ease of scaling, and the readily extended capacity (up to 10 000 litres).

These bioreactors can reach volumes of up to 25 000 L for mammalian cell culture processes 3. Furthermore, it has been estimated that approximately 50% of the biologics will continue to be produced in bioreactor volumes of at least 5000 L 4. There are different approaches for scaling up a process from development to production scale.

Being a large topic area, this review focuses on the biotechnology of cell culture: use of mammalian cells to produce products or the culture of cells as products in their own right. 2. A Brief History of Mammalian Cell Culture The period from 1880 to the early 1900s saw the first development techniques to study the behaviour of cells in vitro.

Scale-Up Process: Scale-up involves the development of culture systems in stages from (small scale) laboratory to (large scale) industry. The methodology adopted to increase the scale of a culture depends on the proliferation of cells and is broadly divided into two categories.

(PDF) Reactor Engineering in Large Scale Animal Cell Culture

Clarifying cell culture broth is the first downstream unit operation in an elaborate sequence of steps required to purify a biological therapeutic. A combination of centrifugation, depth filtration, or tangential-flow filtration (TFF) is used for that operation. The availability of largescale, single-use, depth filtration technology in the recent years, however, has given process developers the capability to improve and simplify downstream processes.

Abstract Mammalian cell culture continues to draw major research efforts. A great deal of progress has recently been made in cellular physiology, especially in factors adversely affecting cell growth or viability. Through molecular genetic manipulation, cells are more readily cultivated in a medium free of animal proteins.

Cell culture is the process by which cells are grown under controlled conditions, generally outside their natural environment. After the cells of interest have been isolated from living tissue, they can subsequently be maintained under carefully controlled conditions.These conditions vary for each cell type, but generally consist of a suitable vessel with a substrate or medium that supplies ...

Experimentation with the ideal case of a continuous discharge in a nozzle centrifuge continues for the harvest of mammalian cell culture media but has not yet found favor in large-scale operation. 5 In the case of discontinuous bowl discharge, the discharge type can be full or partial depending on whether the entire bowl contents are ejected during the discharge. Before discharge, a flush volume is used to push the contents of the bowl through the centrifuge so that yield losses during ...
