Two classes of metrics are introduced for spaces of fuzzy sets. Their equivalence is discussed and basic properties established. A characterisation of compact and locally compact subsets is given in terms of boundedness and  $p$ -mean equileft-continuity, and the spaces shown to be locally compact, complete and separable metric spaces.

The authors of "Metric Spaces of Fuzzy Sets : Theory and Applications", leading experts in this field, have done excellent work, gathering and systematizing basic notions of fuzzy calculus. This book is a must for everyone, whose research includes working with such objects as fuzzy numbers, time-dependent fuzzy processes, fuzzy metric spaces, fuzzy derivatives and integrals and so on.

results from [11] to the case of metric type spaces and cone metric type spaces. The aim of this paper is to generalize the above result. Indeed we prove a fixed point theorem in the set up of fuzzy metric spaces. Finally, one example is presented to verify the effectiveness and applicability of our main results.

In mathematics, a metric space is a set together with a metric on the set. The metric is a function that defines a concept of distance between any two members of the set, which are usually called points. The metric satisfies a few simple properties. Informally: the distance from  $x$  to  $x$  is zero if and only if  $x$  and  $x$  are the same point,; the distance between two distinct points is positive,

With the help of C-contractions having a fixed point, we obtain a characterization of complete fuzzy metric spaces, in the sense of Kramosil and Michalek, that extends the classical theorem of H. Hu (see "Am. Math. Month. 1967, 74, 436–437") that a metric space is complete if and only if any Banach contraction on any of its closed subsets has a fixed point.
