This study aims at analyzing the resilience of Indonesia from two aspects: one is was natural disaster and the other is environmental protection. Therefore the study comprises two parts. The first aims at analyzing Palangkaraya City in Central Kalimantan Province by constructing apartial and a general equilibrium models; hence the existence of illegal settlements can be explained systematically. The models demonstrates a new attempt in city analysis by introducing the expected flood damage rate on households ' assets. Furthermore, a numerical simulation shows a new finding, namely, that the bid rent by representative low-income households in flood-prone areas canreceive higher than the bid rent by the representative high-income households. The second part examines (1) the provision of public goods such as road construction on the Maros–Watampone Road, and (2) the urban economics of Makassar City. In this second part, the analytic hierarchy process is applied to design efficiency with respect to selecting the best type of road construction in a conservation area. As a result, the elevated bridge is determined to be the most suitable type of construction, followed by cut-and-fill and the tunnel system. The second research approach uses a computable general equilibrium (CGE) model that adds environmental objectives to urban economic objectives in Makassar City. The model examines the impact of the carbon tax based on the 2006 input–output table for Makassar City. The results of all simulations of the CGE model indicates that a carbon tax can reduce the volume of CO2 emissions by 8 %.

Contemporary movies and television programs often depict the world as we know it displaced, awash in ocean tides or broken into pieces by devastating earthquakes. The climate data coming through news outlets can seem to reinforce this fatalistic view, with earth warming records hitting new levels year after year. While it can seem like natural disasters are increasingly affecting our world, is there data to support this perception or is this view of events mediated by panicked activists and the media? This anthology explores key ideas and opinions regarding discussions about natural disasters, including subjects such as the frequency and severity of natural disasters, poor infrastructure, human activity, and the economic costs of natural disasters.

Disasters are part of the modern condition, a source of physical anxiety and existential angst, and they are increasing in frequency, cost and severity. Drawing on both disaster research and social theory, this book offers a critical examination of their causes, consequences and future avoidance.
