Measurement of shear strength of unsaturated soils is conducted by the conventional shear box and triaxial equipment needing modifications to allow air-entry in tested specimens. Using the shear strength parameters of unsaturated soil, current soil mechanics applications: e.g. earth pressures, bearing capacity and slope stability of foundations are formulated.

One of the common applications of unsaturated soil mechanics to slope stabilization is in the design and construction of a capillary barrier system (CBS) as a slope cover to minimize rain infiltration into slopes. Capillary barrier system (CBS) CBS works following the unsaturated soil mechanics concepts.

Abstract. A number of geotechnical structures involve the unsaturated upper portion of the soil profile, i.e. the zone above the phreatic surface where the pore-water pressure is negative and the degree of saturation is generally lower than unity. This zone is characterised by soil strength and stiffness higher than the saturated soil below the phreatic surface.
