' Shortest path ' is the term accorded to the shortest distance between any two points, referred to as nodes in graph databases.

Graph - Shortest Path - SQL Server Central

The problem is to find the shortest routes through a network to each point from a given source, and the poster helpfully includes both SQL for a test data set, and links to the origin of the data set, The Stagecoach Problem, and to the Wikipedia page on the algorithm mentioned, Dijkstra's algorithm. I took the problem definition and worked out my own solution and posted it on the thread.

I did using simple ...

Classic Dijkstra algorithm in a SQL Server database

With Dijkstra's Algorithm, you can find the shortest path between nodes in a graph. Particularly, you can find the shortest path from a node (called the "source node") to all other nodes in the graph, producing a shortest-path tree. This algorithm is used in GPS devices to find the shortest path between the current location and the destination.

Dijkstra's Shortest Path Algorithm - A Detailed and Visual...

The method returns a LineString instance with endpoints lying on the borders of the two non-intersecting geometry instances being compared. The length of the LineString returned equals the shortest distance between the two geometry instances. An empty LineString instance is returned when the two geometry instances intersect each other.
