Covering the behaviour, diet, distribution, and evolution of various mammals, this work is illustrated with photographs and original artwork, including photo-stories of momentous events, such as how a cheetah learns to hunt, an elephant's early years, and life in the pouch for a kangaroo.

The last decades of the twentieth century saw a flowering of knowledge about the behaviour, ecology, and evolution of mammals, including ourselves. This new information is brought together, in highly accessible form, by an international team of scientists led by David Macdonald of Oxford University. Uniquely, the information is both authoritative enough to be used as a serious reference work by professionals and presented clearly and attractively enough to fascinate anyone with an interest in wildlife. The New Encyclopedia of Mammals builds on the success of its first edition, published in 1983, to produce an up to date, authoritative, and hugely readable species by species guide to all the mammals of the world.

An illustrated reference guide to the world's mammals, covering every known living species and including information on anatomy, behavior, conservation, and distribution.
