Wire EDM using wire as small as .001 ' ' diameter. Our ability to drill micro start holes makes National Jet Company a natural choice for this precise method to manufacture nearly any type of shaped feature. In addition to the more traditional .004 ' ' and .010 ' ' diameter wire, NJC also offers wire EDM using wire as small as .001 ' ' diameter.

If you have a difficult recessed cut to make Wire EDM is an ideal process. It can be used to make fixtures, collets and jet engine blade slots, mold cooling ribs and reinforcing ribs. Since the electrode does not come in contact with the material, there ' s no adhesion of the work piece to the tool.

A separate EDM head specifically for small hole drilling is mounted on a wire-cut machine and allows large hardened plates to have finished parts eroded from them as needed and without pre-drilling. Small hole EDM is used to drill rows of holes into the leading and trailing edges of turbine blades used in jet engines.

Because hole size must include a spark gap of 0.001 inch around the electrode, hole making for jet engine components typically involves electrodes from 0.015 to 0.028 inch in diameter. Drilling rates for EDM are quite fast. Mr. Beaumont says that a 1-mm hole can penetrate 0.5 inch of Inconel in about 20 seconds.

A shroud set is composed of 12 segments per engine. Birken utilizes several machining centers in order to produce 4 axis CNC milled holes, pockets, radii and slots in the titanium (AMS 4976) material. The parts require wire (EDM) and general turning operations. Segments are bolted together with shoulder screws once the tight tolerances of each segment are met.
